***Abstract*—This documents solves a problem based on Lagrange Interpolation**

1 Problem

Let $\mathbf{A}$ be an n $\times$ n self-adjoint matrix with eigenvalues $\lambda_1, \cdots, \lambda_2$. Let,

$$\|\mathbf{X}\|_2 = \sqrt{\left\|\mathbf{X}_1^2\right\| + \cdots + \left\|\mathbf{X}_n^2\right\|}$$

for $\mathbf{X}$=$(\mathbf{X}_1, \cdots, \mathbf{X}_n) \in \mathbb{C}^n$. If

$$p(\mathbf{A}) = a_0\mathbf{I} + a_1\mathbf{A} + \cdots + a_n\mathbf{A}^n$$

then $sup_{\|\mathbf{X}_2=1\|} \|p(\mathbf{A})\|_2$ is equal to

2 Solution

We know that $\mathbf{A}$ is a self adjoint matrix and hence $\mathbf{A} = \mathbf{A}^*$ with eigen values $\lambda_1, \lambda_2, \cdots, \lambda_n$.Now as we are given,

$$p(\mathbf{A}) = a_0\mathbf{I} + a_1\mathbf{A} + \cdots + a_n\mathbf{A}^n \tag{2.0.1}$$

then,

$$(p(\mathbf{A}))^* = a_0\mathbf{I}^* + a_1\mathbf{A}^* + \cdots + a_n(\mathbf{A}^*)^n \tag{2.0.2}$$

Since, $\mathbf{A} = \mathbf{A}^*$ we can state that,

$$p(\mathbf{A})(p(\mathbf{A}))^* = p((\mathbf{A}))^* p(\mathbf{A}) \tag{2.0.3}$$

Hence p(A) is a normal matrix. Now using spectral theorem for a normal matrix,

$$\|p(A)\|_2 = \rho(p(\mathbf{A})) \tag{2.0.4}$$

$$= max\{\|\alpha\| : \alpha \text{ is the eigen values of p(A)}\} \tag{2.0.5}$$

$$= max\{\left\|p(\lambda_j)\right\| : j = 1, 2, \cdots n\} \tag{2.0.6}$$

$$= max\{\left\|a_0 + a_1\lambda_j + \cdots + a_n{\lambda_j}^n\right\| : j = 1, 2, \cdots n\} \tag{2.0.7}$$
