***Abstract*—This documents solves a problem based on vector spaces.**

1 Problem

Let $\mathbb{V}$ be the set of all complex-valued functions f on the real line such that

$$f(-t) = \overline{f(t)}$$

The bar denotes complex conjugation.Show that $\mathbb{V}$,with the operations

$$(f + g)(t) = f(t) + g(t)$$
$$(cf)(t) = cf(t)$$

is a vector space over the field of real numbers. Give an example of a function in V which is not real valued.

2 Solution

Let's start by showing that scalar multiplication and vector addition is defined on set $\mathbb{V}$ Let's take c $\in \mathbb{R}$

$$\implies (cf)(-t) \tag{2.0.1}$$
$$= cf(-t) \tag{2.0.2}$$
$$= c\overline{f(t)} \tag{2.0.3}$$
$$= \overline{cf(t)} \tag{2.0.4}$$

Now for vector addition, Let's take f(-t)=f(t) and g(-t)=g(t) then (f+g) should also show the property (f+g)(-t)=(f+g)(t)

$$\implies (f + g)(-t) \tag{2.0.5}$$
$$= f(-t) + g(-t) \tag{2.0.6}$$
$$= \overline{f(t)} + \overline{g(t)} \tag{2.0.7}$$
$$= \overline{f(t) + g(t)} \tag{2.0.8}$$

Hence both scalar multiplication and vector addition hold true.Now we have to prove that the functions $\in \mathbb{V}$ hold the property for additivity and homogeneity. So, we have to prove that (cf+g)(t) is qual to c(f)+g(t).

$$(cf + g)(t) \tag{2.0.9}$$
$$= (cf)(t) + g(t) \tag{2.0.10}$$
$$= cf(t) + g(t) \tag{2.0.11}$$

3 Example

Let's take f(x)=a+ix

$$f(1) = a + i \tag{3.0.1}$$

Hence, f(x) is not real valued.Now,

$$f(x) = a + ix \tag{3.0.2}$$
$$f(-x) = a - ix \tag{3.0.3}$$
$$f(-x) = \overline{f(x)} \tag{3.0.4}$$

Since a,b and x $\in \mathbb{R}$, so f $\in \mathbb{V}$
