Abstract—This documents solves a problem based on Row Echelon form.

1 Problem

Suppose **R** and **R**' are 2×3 row-reduced echelon matrices and that the system **RX**=0 and **R**'**X**=0 have exactly the same solutions. Prove that **R**=**R**'.

2 Solution

Since **R** and **R**' are 2×3 row-reduced echelon matrices they can be of following three types:-

1) Suppose matrix R has one non-zero row then RX=0 will have two free variables. Since R'X=0 will have the exact same solution as RX=0, R'X=0 will also have two free variables. Thus R' have one non zero row. Now let's consider a matrix A with the first row as the non-zero row R and second row as the second row of R'.

$$\mathbf{R} = \begin{pmatrix} 1 & a & b \\ 0 & 0 & 0 \end{pmatrix} \tag{2.0.1}$$

$$\mathbf{R}' = \begin{pmatrix} 1 & c & d \\ 0 & 0 & 0 \end{pmatrix} \tag{2.0.2}$$

$$\mathbf{A} = \mathbf{R} + \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \mathbf{R}' \tag{2.0.3}$$

$$\mathbf{A} = \begin{pmatrix} 1 & a & b \\ 1 & c & d \end{pmatrix} \tag{2.0.4}$$

Let X satisfy

$$\mathbf{RX} = 0 \tag{2.0.5}$$

$$\mathbf{R}'\mathbf{X} = 0 \tag{2.0.6}$$

Now multiplying A and X and substituting (2.0.3).

$$= \mathbf{AX} \qquad (2.0.7)$$

$$= \left(\mathbf{R} + \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \mathbf{R}' \right) \mathbf{X} \tag{2.0.8}$$

$$= \mathbf{RX} + \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \mathbf{R}' \mathbf{X} \tag{2.0.9}$$

From (2.0.5) and (2.0.6)

$$\mathbf{AX} = 0 \tag{2.0.10}$$

Now, considering the augmented matrix,

$$\begin{pmatrix}
1 & a & b & | & 0 \\
1 & c & d & | & 0
\end{pmatrix}$$
(2.0.11)

$$\stackrel{R_2=R_2-R_1}{\longleftrightarrow} \begin{pmatrix} 1 & a & b & 0 \\ 0 & c-a & d-b & 0 \end{pmatrix}$$

$$(2.0.12)$$

Now, Assuming c-a $\neq 0$ and reducing (2.0.12) to row echelon form.

$$\begin{pmatrix}
1 & a & b & 0 \\
0 & c - a & d - b & 0
\end{pmatrix}$$
(2.0.13)

$$\stackrel{R_2 = \frac{R_2}{R_1}}{\longleftrightarrow} \begin{pmatrix} 1 & a & b & 0 \\ 0 & 1 & \frac{d-b}{c-a} & 0 \end{pmatrix} \\
(2.0.14)$$

We can see that if $c-a \neq 0$ then second row wouldn't come out to be zero which isn't possible because rows will be linear combination of each other as **R** and **R**' have the same solution. So, c-a=0,

$$c - a = 0 (2.0.15)$$

$$c = a$$
 (2.0.16)

$$d - b = 0 (2.0.17)$$

$$d = b$$
 (2.0.18)

Hence, R=R'

2) Let **R** and **R**' have all rows as non zero.

$$\mathbf{R} = \begin{pmatrix} 1 & 0 & b \\ 0 & 1 & c \end{pmatrix} \tag{2.0.19}$$

$$\mathbf{R}' = \begin{pmatrix} 1 & 0 & e \\ 0 & 1 & f \end{pmatrix} \tag{2.0.20}$$

Now let's consider another matrix A whose first two rows are from R and last two rows are from R'

$$\mathbf{A} = \begin{pmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \\ 0 & 0 \end{pmatrix} \mathbf{R} + \begin{pmatrix} 0 & 0 \\ 0 & 0 \\ 1 & 0 \\ 0 & 1 \end{pmatrix} \mathbf{R}'$$
 (2.0.21)

$$\mathbf{A} = \begin{pmatrix} 1 & 0 & b \\ 0 & 1 & c \\ 1 & 0 & e \\ 0 & 1 & f \end{pmatrix} \tag{2.0.22}$$

Let X satisfy

$$\mathbf{RX} = 0 \tag{2.0.23}$$

$$\mathbf{X}^T \mathbf{R} = 0 \tag{2.0.24}$$

Here,

$$\mathbf{R} = \begin{pmatrix} \mathbf{I} & \mathbf{a} \end{pmatrix} \tag{2.0.25}$$

$$\mathbf{a} = \begin{pmatrix} b \\ c \end{pmatrix} \tag{2.0.26}$$

Let,

$$\mathbf{X} = \begin{pmatrix} \mathbf{y}^T & z \end{pmatrix} \tag{2.0.27}$$

where z is a scalar constant. Now, substituting (2.0.27) and (2.0.25) in (2.0.24)

$$\binom{\mathbf{y}^T}{z} \Big(\mathbf{I} \quad \mathbf{a} \Big) = 0$$
 (2.0.28)

Now for,

$$\mathbf{R}'\mathbf{X} = 0 \tag{2.0.29}$$

$$\mathbf{X}^T \mathbf{R}' = 0 \tag{2.0.30}$$

Here,

$$\mathbf{R}' = \begin{pmatrix} \mathbf{I} & \mathbf{a}' \end{pmatrix} \tag{2.0.31}$$

$$\mathbf{a}' = \begin{pmatrix} e \\ f \end{pmatrix} \tag{2.0.32}$$

Let,

$$\mathbf{X} = \begin{pmatrix} \mathbf{y}^T & z \end{pmatrix} \tag{2.0.33}$$

where z is a scalar constant. Now, substituting (2.0.33) and (2.0.31) in (2.0.30)

$$\begin{pmatrix} \mathbf{y}^T \\ z \end{pmatrix} \begin{pmatrix} \mathbf{I} & \mathbf{a}' \end{pmatrix} = 0$$
 (2.0.34)

Now multiplying A and X and substituting (2.0.21).

$$= AX$$
 (2.0.35)

$$= \begin{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \\ 0 & 0 \end{pmatrix} \mathbf{R} + \begin{pmatrix} 0 & 0 \\ 0 & 0 \\ 1 & 0 \\ 0 & 1 \end{pmatrix} \mathbf{R}' \mathbf{X}$$
 (2.0.36)

$$= \begin{pmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \\ 0 & 0 \end{pmatrix} \mathbf{R} \mathbf{X} + \begin{pmatrix} 0 & 0 \\ 0 & 0 \\ 1 & 0 \\ 0 & 1 \end{pmatrix} \mathbf{R}' \mathbf{X}$$
 (2.0.37)

From (2.0.23) and (2.0.25)

$$\mathbf{AX} = 0 \tag{2.0.38}$$

Now, considering the augmented matrix,

$$\begin{pmatrix}
1 & 0 & b & | & 0 \\
0 & 1 & c & | & 0 \\
1 & 0 & e & | & 0 \\
0 & 1 & f & | & 0
\end{pmatrix}$$
(2.0.39)

$$\stackrel{R_3=R_3-R_1}{\longleftrightarrow} \begin{pmatrix}
1 & 0 & b & 0 \\
0 & 1 & c & 0 \\
1 & 0 & e-b & 0 \\
0 & 1 & f-c & 0
\end{pmatrix}$$
(2.0.40)

$$\stackrel{R_4 = R_4 - R_2}{\longleftrightarrow} \begin{pmatrix}
1 & 0 & b & 0 \\
0 & 1 & c & 0 \\
0 & 0 & e - b & 0 \\
0 & 0 & f - c & 0
\end{pmatrix}$$
(2.0.41)

$$\stackrel{R_3 = \frac{R_3}{e - b}}{\longleftrightarrow} \begin{pmatrix}
1 & a & b & 0 \\
0 & 1 & c & 0 \\
0 & 0 & e - b & 0 \\
0 & 0 & f - c & 0
\end{pmatrix} (2.0.42)$$

$$\stackrel{R_3 = \frac{R_3}{f - c}}{\longleftrightarrow} \begin{pmatrix}
1 & 0 & b & 0 \\
0 & 1 & c & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 1 & 0
\end{pmatrix}$$
(2.0.43)

$$\stackrel{R_4 = \frac{R_4}{f - c}}{\longleftrightarrow} \begin{pmatrix}
1 & 0 & b & | & 0 \\
0 & 1 & c & | & 0 \\
0 & 0 & 1 & | & 0 \\
0 & 0 & 1 & | & 0
\end{pmatrix}$$
(2.0.44)

$$\stackrel{R_4=R_4-R_3}{\longleftrightarrow} \begin{pmatrix}
1 & 0 & b & | & 0 \\
0 & 1 & c & | & 0 \\
0 & 0 & 1 & | & 0 \\
0 & 0 & 0 & | & 0
\end{pmatrix}$$
(2.0.45)

$$\stackrel{R_1=R_1-bR_3}{\longleftrightarrow} \begin{pmatrix}
1 & 0 & 0 & | & 0 \\
0 & 1 & c & | & 0 \\
0 & 0 & 1 & | & 0 \\
0 & 0 & 0 & | & 0
\end{pmatrix}$$
(2.0.46)

$$\stackrel{R_2=R_2-cR_3}{\longleftrightarrow} \begin{pmatrix}
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 0
\end{pmatrix} (2.0.47)$$

We can see that if e-b $\neq 0$ then third row wouldn't come out to be zero which isn't possible because rows will be linear combination of each other as **R** and **R**' have the same solution. So,

$$d = 0 (2.0.48)$$

$$a = 0 (2.0.49)$$

$$e - b = 0 (2.0.50)$$

$$e = b (2.0.51)$$

$$f - c = 0 (2.0.52)$$

$$f = c (2.0.53)$$

Hence, R=R'

3) Suppose matrix **R** have all the rows as zero then **RX**=0 will be satisfied for all values of **X**. We know that **R**'**X**=0 will have the exact same solution as **RX**=0 then we can say that for all values of **X**=0 equation **R**'**X**=0 will be satisfied Hence, **R**'=**R**=0.
