Abstract—This documents solves a problem based on Row Echelon form.

## 1 Problem

Suppose **R** and **R**' are  $2 \times 3$  row-reduced echelon matrices and that the system **RX**=0 and **R**'**X**=0 have exactly the same solutions. Prove that **R**=**R**'.

## 2 Solution

Since **R** and  $\mathbf{R}'$  are  $2 \times 3$  row-reduced echelon matrices they can be of following three types:-

Suppose matrix R has one non-zero row then RX=0 will have two free variables. Since R'X=0 will have the exact same solution as RX=0, R'X=0 will also have two free variables. Thus R' have one non zero row. Now let's consider a matrix A with the first row as the non-zero row R and second row as the second row of R'.

$$\mathbf{R} = \begin{pmatrix} 1 & a & b \\ 0 & 0 & 0 \end{pmatrix} \tag{2.0.1}$$

$$\mathbf{R}' = \begin{pmatrix} 1 & c & d \\ 0 & 0 & 0 \end{pmatrix} \tag{2.0.2}$$

$$\mathbf{A} = \mathbf{R} + \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \mathbf{R}' \tag{2.0.3}$$

$$\mathbf{A} = \begin{pmatrix} 1 & a & b \\ 1 & c & d \end{pmatrix} \tag{2.0.4}$$

Any **X** satisfying **RX**=0 and R'**X**=0 will also satisfy **AX**=0 and thus, **A** in it's reduced form must have one non-zero row which is possible only when the rows of **A** are equal because leading entries in both the vectors equals one. Thus,  $\mathbf{R} = \mathbf{R}'$ .

2) Let **R** and **R**' have all rows as non zero. Let  $\mathbf{R} = \begin{pmatrix} 1 & a & b \\ 0 & 1 & c \end{pmatrix}$  and  $\mathbf{R}' = \begin{pmatrix} 1 & d & e \\ 0 & 1 & f \end{pmatrix}$ . Now let's consider another matrix A whose first two rows are from R and last two rows are from R'.

$$\mathbf{A} = \begin{pmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \\ 0 & 0 \end{pmatrix} \mathbf{R} + \begin{pmatrix} 0 & 0 \\ 0 & 0 \\ 1 & 0 \\ 0 & 1 \end{pmatrix} \mathbf{R}'$$
 (2.0.5)

$$\mathbf{A} = \begin{pmatrix} 1 & a & b \\ 0 & 1 & c \\ 1 & d & e \\ 0 & 1 & f \end{pmatrix} \tag{2.0.6}$$

Any value of  $\mathbf{X}$  satisfying  $\mathbf{R}\mathbf{X}=0$  and  $\mathbf{R}'\mathbf{X}=0$  will also satisfy  $\mathbf{A}\mathbf{X}=0$ . Therefore row reduced echelon form of  $\mathbf{A}$  must have two non-zero rows, which implies the rows of  $\mathbf{R}$  and  $\mathbf{R}'$  must be a linear combination of each other. It is possible only when the leading coefficients of the first row of  $\mathbf{R}$  and  $\mathbf{R}'$  occur in the same column. By similar argument, the leading coefficients of the second rows must also occur in the same column. Thus, the only way the rows of  $\mathbf{R}$  and  $\mathbf{R}'$  are linear combination of one another is that the respective rows coincide and hence  $\mathbf{R} = \mathbf{R}'$ .

3) Suppose matrix **R** have all the rows as zero then **RX**=0 will be satisfied for all values of **X**. We know that **R'X**=0 will have the exact same solution as **RX**=0 then we can say that for all values of **X**=0 equation **R'X**=0 will be satisfied hence, **R'=R=0**.
